**2. Citations and explanations (Rule 70.7)**

The claimed invention relates to new compounds 3,7 diazobicyclo[3.3.1]nonanes (bispidines), useful in the treatment of cardiac arrhythmias and the process for preparation thereof.

EP 0 308 843 A2 relates to structurally close bispidine derivatives, drugs containing these derivatives and their use for the preparation of antiarrhythmic agents. There are several possibilities for the preparation of known compounds of the general formula I having a urea group (page 4 , line 48-52).

According to what is known from the cited document, is it obvious to a person skilled in the art that the claimed bispiridine derivatives can be used in the treatment of cardiac arrhythmias.

The applicant has not shown in a convincing manner that the compounds according to the claimed invention have any unexpected beneficial effects compared to those in the cited document.

Thus, claims 1-23 and 25-37 are considered to have novelty but to lack inventive step.

## NEW BISPIDINE COMPOUNDS USEFUL IN THE TREATMENT OF CARDIAC ARRHYTHMIAS

### Field of the Invention

5

This invention relates to novel pharmaceutically useful compounds, in particular compounds which are useful in the treatment of cardiac arrhythmias.

### 10 Background and Prior Art

Cardiac arrhythmias may be defined as abnormalities in the rate, regularity, or site of origin of the cardiac impulse or as disturbances in conduction which causes an abnormal sequence of activation. Arrhythmias may be  
15 classified clinically by means of the presumed site of origin (i.e. as supraventricular, including atrial and atrioventricular, arrhythmias and ventricular arrhythmias) and/or by means of rate (i.e. bradyarrhythmias (slow) and tachyarrhythmias (fast)).

20 In the treatment of cardiac arrhythmias, the negative outcome in clinical trials (see, for example, the outcome of the Cardiac Arrhythmia Suppression Trial (CAST) reported in New England Journal of Medicine, 321, 406 (1989)) with "traditional" antiarrhythmic drugs, which act primarily by slowing the conduction velocity (class I antiarrhythmic drugs), has prompted  
25 drug development towards compounds which selectively delay cardiac repolarization, thus prolonging the QT interval. Class III antiarrhythmic drugs may be defined as drugs which prolong the trans-membrane action potential duration (which can be caused by a block of outward  $K^+$  currents

or from an increase of inward ion currents) and refractoriness, without affecting cardiac conduction.

One of the key disadvantages of hitherto known drugs which act by delaying repolarization (class III or otherwise) is that they all are known to exhibit a unique form of proarrhythmia known as *torsades de pointes* (turning of points), which may, on occasion be fatal. From the point of view of safety, the minimisation of this phenomenon (which has also been shown to be exhibited as a result of administration of non-cardiac drugs such as phenothiazines, tricyclic antidepressants, antihistamines and antibiotics) is a key problem to be solved in the provision of effective antiarrhythmic drugs.

Antiarrhythmic drugs based on bispidines (3,7-diazabicyclo[3.3.1]nonanes), are known from *inter alia* international patent application WO 91/07405, European patent applications 306 871, 308 843 and 655 228 and US patents 3,962,449, 4,556,662, 4,550,112, 4,459,301 and 5,468,858, as well as journal articles including *inter alia* J. Med. Chem. **39**, 2559, (1996), Pharmacol. Res., **24**, 149 (1991), Circulation, **90**, 2032 (1994) and Anal. Sci. **9**, 429, (1993). Known bispidine-based antiarrhythmic compounds include bisaramil (3-methyl-7-ethyl-9 $\alpha$ ,4'-(Cl-benzoyloxy)-3,7-diazabicyclo[3.3.1]nonane), tedisamil (3',7'-bis(cyclopropylmethyl)spiro-(cyclopentane-1,9')-3,7-diazabicyclo[3.3.1]nonane), SAZ-VII-22 (3-(4-chlorobenzoyl)-7-*iso*-propyl-3,7-diazabicyclo[3.3.1]nonane), SAZ-VII-23 (3-benzoyl-7-*iso*-propyl-3,7-diazabicyclo[3.3.1]nonane), GLG-V-13 (3-[4-(1H-imidazol-1-yl)benzoyl]-7-*iso*-propyl-3,7-diazabicyclo[3.3.1]nonane), KMC-IV-84 (7-[4'-(1H-imidazolo-1-yl)benzenesulfonyl]-3-*iso*-propyl-3,7-diazabicyclo[3.3.1]nonane dihydroperchlorate and ambasilide (3-(4-aminobenzoyl)-7-benzyl-3,7-diazabicyclo[3.3.1]nonane).

We have surprisingly found that a novel group of bispidine-based compounds exhibit electrophysiological activity, preferably class III electrophysiological activity, and are therefore expected to be useful in the treatment of cardiac arrhythmias.

The compounds of the invention may exhibit tautomerism. All tautomeric forms and mixtures thereof are included within the scope of the invention.

- The compounds of the invention may also contain one or more asymmetric carbon atoms and may therefore exhibit optical and/or diastereoisomerism. Diastereoisomers may be separated using conventional techniques, e.g. chromatography or fractional crystallisation. The various stereoisomers may be isolated by separation of a racemic or other mixture of the compounds using conventional, e.g. fractional crystallisation or HPLC, techniques.
- Alternatively the desired optical isomers may be made by reaction of the appropriate optically active starting materials under conditions which will not cause racemisation or epimerisation, or by derivatisation, for example with a homochiral acid followed by separation of the diastereomeric esters by conventional means (e.g. HPLC, chromatography over silica). All stereoisomers are included within the scope of the invention.

- Alkyl groups that R<sup>1</sup>, R<sup>2</sup>, R<sup>2b</sup>, R<sup>2c</sup>, R<sup>2d</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>8</sup>, R<sup>9</sup>, R<sup>10</sup>, R<sup>11</sup>, R<sup>11a</sup>, R<sup>12</sup>, R<sup>13</sup>, R<sup>14</sup>, R<sup>15</sup>, R<sup>15a</sup>, R<sup>16</sup>, R<sup>17</sup>, R<sup>18</sup>, R<sup>19</sup>, R<sup>20</sup>, R<sup>21</sup>, R<sup>22</sup>, R<sup>41</sup>, R<sup>42</sup>, R<sup>43</sup>, R<sup>44</sup>, R<sup>45</sup> and R<sup>46</sup> may represent, that R<sup>12</sup> may include, and with which R<sup>3</sup>, R<sup>4</sup>, R<sup>7</sup>, R<sup>8</sup> and R<sup>12</sup> may be substituted; and alkoxy groups that R<sup>4</sup> may represent, and with which R<sup>4</sup>, R<sup>7</sup>, R<sup>8</sup> and R<sup>12</sup> may be substituted; may be linear or, when there is a sufficient number (i.e. three) of carbon atoms, be branched and/or cyclic. Further, when there is a sufficient number (i.e. four) of carbon atoms, such alkyl and alkoxy groups may

also be part cyclic/acyclic. Such alkyl and alkoxy groups may also be saturated or, when there is a sufficient number (i.e. two) of carbon atoms, be unsaturated and/or interrupted by oxygen.

5 Alkylene groups that  $R^3$  and  $R^4$ ,  $R^8$  and  $R^9$ ,  $R^{15}$  and  $R^{15a}$ , A, and B, may represent; and  $-(CH_2)_m-$ ,  $-(CH_2)_n-$ ,  $-(CH_2)_q-$  and  $-(CH_2)_r-$  chains that A, B and  $R^4$  (as appropriate) may include, may be linear or, when there is a sufficient number (i.e. two) of carbon atoms, be branched. Such alkylene groups and  $-(CH_2)-$  containing chains may also be saturated or, when there  
10 is a sufficient number (i.e. two) of carbon atoms, be unsaturated and/or interrupted by oxygen.

15

For the avoidance of doubt, each  $R^{10}$ ,  $R^{11}$ , and  $R^{11a}$ , group identified herein is independent of other  $R^{10}$ ,  $R^{11}$ , and  $R^{11a}$ , groups, respectively. For example, when  $R^4$  and  $R^7$  both represent aryl substituted by  $-C(O)R^{10}$ , the two individual  $-C(O)R^{10}$  substituents are independent of one another, and are  
20 not necessarily identical (though this possibility is not excluded).

Compounds of formula XV may be prepared by reaction of a  
 10 corresponding compound of formula I, as hereinbefore defined, in which  $R^5$  represents  $-OH$ , with a compound of formula XXXIII

wherein  $R^y$  is as hereinbefore defined, for example at between  $-10$  and  $25^\circ C$  in the presence of a suitable solvent (e.g. dichloromethane),  
 15 followed by reaction with a suitable source of the azide ion (e.g. sodium azide) for example at between ambient and reflux temperature in the presence of an appropriate solvent (e.g. DMF) and a suitable base (e.g.  $NaHCO_3$ ).

20 Compounds of formula XV may alternatively be prepared by reaction of a corresponding compound of formula VI, as hereinbefore defined with a compound of formula XXXIIIA,

wherein  $L^2$ ,  $R^6$ ,  $R^7$ , A and B are as hereinbefore defined, for example  
 25 under analogous conditions to those described hereinbefore for preparation of compounds of formula I (process step (e)).

Compounds of formula XX may be prepared by replacement of the OH group of a compound of formula I in which R<sup>5</sup> represents OH with an L<sup>2</sup> group under conditions that are well known to those skilled in the art.

- 5 Compounds of formula XXIA may be prepared by reaction of a corresponding compound of formula X with hydroxylamine, for example at elevated temperature (e.g. at reflux) in the presence of a suitable organic solvent (e.g. methanol).
- 10 Compounds of formula XXII are known in the literature or are readily available using known techniques. For example, compounds of formula XXII in which R<sup>1</sup> and R<sup>2</sup> together represent -O-(CH<sub>2</sub>)<sub>2</sub>-O-, -(CH<sub>2</sub>)<sub>3</sub>-, -(CH<sub>2</sub>)<sub>4</sub>- or -(CH<sub>2</sub>)<sub>5</sub>-, and R<sup>41</sup>, R<sup>42</sup>, R<sup>43</sup>, R<sup>44</sup>, R<sup>45</sup> and R<sup>46</sup> all represent H, may be prepared by reduction of a compound of formula XXXIV,

15

XXXIV

- 20 wherein R<sup>1a</sup> and R<sup>2a</sup> together represent -O-(CH<sub>2</sub>)<sub>2</sub>-O-, -(CH<sub>2</sub>)<sub>3</sub>-, -(CH<sub>2</sub>)<sub>4</sub>- or -(CH<sub>2</sub>)<sub>5</sub>-, in the presence of a suitable reducing agent (e.g. LiAlH<sub>4</sub>) under conditions which are well known to those skilled in the art.

Compounds of formula XXXIIIA may be prepared in analogous fashion to compounds of formula XV (i.e. from the corresponding alcohol).

Compounds of formulae X, XXIII and XXV (in which, in all cases, R<sup>45</sup> and R<sup>46</sup> both represent H), may be prepared, advantageously, by reaction of (as appropriate) either (i) a compound of formula XXXV,

- 5 wherein R<sup>z</sup> represents C<sub>1-10</sub> alkyl or C<sub>1-3</sub> alkylaryl (e.g. alkylphenyl, such as benzyl) and R<sup>41</sup>, R<sup>42</sup>, R<sup>43</sup> and R<sup>44</sup> are as hereinbefore defined, or (ii) 4-piperidone (or a protected derivative thereof), with (as appropriate) either (1) a compound of formula XXXVI,

- 10 wherein R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, A and B are as hereinbefore defined, or (2) NH<sub>3</sub> (or a protected (e.g. benzyl) derivative thereof), in all cases in the presence of a formaldehyde (i.e. an appropriate source of formaldehyde, such as paraformaldehyde or formalin solution) and, in the case of compounds of formulae X and XXV, conversion of the C(O)OR<sup>z</sup> group in the resultant  
 15 intermediate to a C(O)N(R<sup>3</sup>)(R<sup>4</sup>) group using techniques such as those described herein (e.g. process step (c) above).

- The formation of compounds of formulae X, XXIII and XXV may be carried out in this way for example at between room temperature and reflux  
 20 (depending upon the concentration of the reactants) in the presence of an appropriate solvent (e.g. ethanol or methanol) and, preferably, in the presence of an organic acid (e.g. a C<sub>1-6</sub> carboxylic acid, especially acetic acid).

It will be also appreciated by those skilled in the art that compounds of formula XXII in which R<sup>1</sup> and R<sup>2</sup> both represent H may also be prepared *via* this method (i.e. by reaction of a compound of 4-piperidone (or a  
5 protected derivative thereof) with NH<sub>3</sub> (or a protected derivative thereof) in the presence of a formaldehyde), provided that the intermediate so formed is subsequently reduced under appropriate reaction conditions.

The skilled person will also appreciate that this process may also be used  
10 to prepare compounds of formula I in which R<sup>41</sup> and R<sup>42</sup> are H, and R<sup>45</sup> and/or R<sup>46</sup> are other than H, for example by:

- (i) reacting a compound of formula XXXV in which R<sup>41</sup> and/or R<sup>42</sup> is/are other than H with, for example, benzylamine or a derivative thereof;
- 15 (ii) removal of the -C(O)OR<sup>z</sup> unit;
- (iii) reaction at the free bispidine nitrogen of the resultant compound with a compound of formula VIII as hereinbefore defined;
- (iv) removal of the benzyl protecting group; and
- (v) reaction at the free bispidine nitrogen of the resultant compound  
20 with, for example, a compound of formula III or IV as hereinbefore defined,

under conditions well known to those skilled in the art including those described hereinbefore. This reaction will be accompanied by, at some point, conversion of the bridgehead carbonyl functionality to the desired  
25 R<sup>1</sup>/R<sup>2</sup> groups.

Compounds of formula XXXIV may be prepared in accordance with techniques which are well known to those skilled in the art. For example, compounds of formula XXXIV in which R<sup>1a</sup> and R<sup>2a</sup> together represent

-(CH<sub>2</sub>)<sub>3</sub>-, -(CH<sub>2</sub>)<sub>4</sub>- or -(CH<sub>2</sub>)<sub>5</sub>- may be prepared by reaction of a compound of formula XXXVII,

XXXVII

wherein R<sup>1a'</sup> and R<sup>2a'</sup> together represent -(CH<sub>2</sub>)<sub>3</sub>-, -(CH<sub>2</sub>)<sub>4</sub>- or -(CH<sub>2</sub>)<sub>5</sub>-,  
 5 with a mixture of phosphoric acid and sulfuric acid, for example at 120°C.

Compounds of formula XXXVI are well known in the literature or are readily available using known techniques. For example, compounds of formula XXXVI wherein R<sup>5</sup> represents OH, R<sup>6</sup> represents H and A represents CH<sub>2</sub> may be prepared by reaction of a compound of formula  
 10 VII in which R<sup>6</sup> represents H and X represents O with ammonium hydroxide under conditions which are well known to those skilled in the art.

15 Compounds of formulae III, VA, XIA, XII, XIV, XVI, XVII, XVIII, XIX, XXI, XXIB, XXIV, XXVI, XXVII, XXVIII, XXVIII A, XXIX, XXX, XXXI, XXXIA, XXXII, XXXIII, XXXV and XXXVII and derivatives thereof, are either commercially available, are known in the literature, or may be obtained either by analogy with the processes  
 20 described herein, or by conventional synthetic procedures, in accordance with standard techniques, from readily available starting materials using appropriate reagents and reaction conditions.

Substituents on the aryl (e.g. phenyl), and (if appropriate) heterocyclic,  
 25 group(s) in compounds defined herein may be converted to other claimed

substituents using techniques well known to those skilled in the art. For example, nitrobenzene may be reduced to an aminobenzene, hydroxy may be converted to alkoxy, alkoxy may be hydrolysed to hydroxy, etc.

- 5 The compounds of the invention may be isolated from their reaction mixtures using conventional techniques.

It will be appreciated by those skilled in the art that, in the process described above, the functional groups of intermediate compounds may be,  
10 or may need to be, protected by protecting groups.

Functional groups which it is desirable to protect include hydroxy, amino and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl and diarylalkylsilyl groups (e.g. *tert*-butyldimethylsilyl, *tert*-  
15 butyldiphenylsilyl or trimethylsilyl), tetrahydropyranyl and alkylcarbonyloxy groups (e.g. methyl- and ethylcarbonyloxy groups). Suitable protecting groups for amino include benzyl, *tert*-butyloxycarbonyl, 9-fluorenylmethoxycarbonyl or benzyloxycarbonyl. Suitable protecting groups for carboxylic acid include C<sub>1-6</sub> alkyl or benzyl esters.

20

The protection and deprotection of functional groups may take place before or after any of the reaction steps described hereinbefore.

Protecting groups may be removed in accordance with techniques which are  
25 well known to those skilled in the art and as described hereinafter.

The use of protecting groups is fully described in "Protective Groups in Organic Chemistry", edited by J W F McOmie, Plenum Press (1973), and

"Protective Groups in Organic Synthesis", 2nd edition, T W Greene & P G M Wutz, Wiley-Interscience (1991).

Persons skilled in the art will appreciate that, in order to obtain compounds  
5 of the invention in an alternative, and, on some occasions, more convenient,  
manner, the individual process steps mentioned herein may be performed in  
a different order, and/or the individual reactions may be performed at a  
different stage in the overall route (i.e. substituents may be added to and/or  
chemical transformations performed upon, different intermediates to those  
10 associated hereinbefore with a particular reaction). This will depend *inter*  
*alia* on factors such as the nature of other functional groups present in a  
particular substrate, the availability of key intermediates and the protecting  
group strategy (if any) to be adopted. Clearly, the type of chemistry  
involved will influence the choice of reagent that is used in the said  
15 synthetic steps, the need, and type, of protecting groups that are employed,  
and the sequence for accomplishing the synthesis.

It will also be appreciated by those skilled in the art that, although certain  
protected derivatives of compounds of formula I, which may be made prior  
20 to a final deprotection stage, may not possess pharmacological activity as  
such, they may be administered parenterally or orally and thereafter  
metabolised in the body to form compounds of the invention which are  
pharmacologically active. Such derivatives may therefore be described as  
"prodrugs". Moreover, we have found that certain compounds of formula I  
25 may act as prodrugs of other compounds of formula I.

All prodrugs of compounds of formula I are included within the scope of the  
invention.

Some of the intermediates referred to hereinbefore are novel. According to a further aspect of the invention there is thus provided: (a) a compound of formula II, as hereinbefore defined or a protected derivative thereof, provided that R<sup>7</sup> does not represent optionally substituted phenyl; (b) a compound of formula V, as hereinbefore defined or a protected derivative thereof, provided that R<sup>7</sup> does not represent optionally substituted phenyl; (c) a compound of formula X as hereinbefore defined or a protected derivative thereof; (d) a compound of formula XI as hereinbefore defined or a protected derivative thereof; (e) a compound of formula XIII, as hereinbefore defined or a protected derivative thereof; (f) a compound of formula XV, as hereinbefore defined or a protected derivative thereof; (g) a compound of formula XX, as hereinbefore defined or a protected derivative thereof; (h) a compound of formula XXIII, as hereinbefore defined or a protected derivative thereof, provided that R<sup>7</sup> does not represent optionally substituted phenyl; and (i) a compound of formula XXV, as hereinbefore defined or a protected derivative thereof.

#### Medical and pharmaceutical use

20

The compounds of the invention are useful because they possess pharmacological activity. They are therefore indicated as pharmaceuticals.

Thus, according to a further aspect of the invention there is provided the compounds of the invention for use as pharmaceuticals.

25

In particular, the compounds of the invention exhibit myocardial electrophysiological activity, for example as demonstrated in the test described below.

- 5 The compounds of the invention are thus expected to be useful in both the prophylaxis and the treatment of arrhythmias, and in particular atrial and ventricular arrhythmias.

10 The compounds of the invention are thus indicated in the treatment or prophylaxis of cardiac diseases, or in indications related to cardiac diseases, in which arrhythmias are believed to play a major role, including ischaemic heart disease, sudden heart attack, myocardial infarction, heart failure, cardiac surgery and thromboembolic events.

- 15 In the treatment of arrhythmias, compounds of the invention have been found to selectively delay cardiac repolarization, thus prolonging the QT interval, and, in particular, to exhibit class III activity. Although compounds of the invention have been found to exhibit class III activity in particular, in the treatment of arrhythmias, their mode(s) of activity is/are  
20 not necessarily restricted to this class.

According to a further aspect of the invention, there is provided a method of treatment of an arrhythmia which method comprises administration of a therapeutically effective amount of a compound of the invention to a person  
25 suffering from, or susceptible to, such a condition.

## Pharmaceutical preparations

The compounds of the invention will normally be administered orally, subcutaneously, intravenously, intraarterially, transdermally, intranasally, by inhalation, or by any other parenteral route, in the form of pharmaceutical preparations comprising the active ingredient either as a free base, a pharmaceutically acceptable ion exchanger or a non-toxic organic or inorganic acid addition salt, in a pharmaceutically acceptable dosage form. Depending upon the disorder and patient to be treated, as well as the route of administration, the compositions may be administered at varying doses.

The compounds of the invention may also be combined with any other drugs useful in the treatment of arrhythmias and/or other cardiovascular disorders.

According to a further aspect of the invention there is thus provided a pharmaceutical formulation including a compound of the invention in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier.

Suitable daily doses of the compounds of the invention in therapeutic treatment of humans are about 0.05 to 5.0 mg/kg body weight at parenteral administration.

The compounds of the invention have the advantage that they are effective against cardiac arrhythmias.

Compounds of the invention may also have the advantage that they may be more efficacious than, be less toxic than, have a broader range of activity (including exhibiting any combination of class I, class II, class III and/or class IV activity (especially class I, class II and/or class IV activity in addition to class III activity)) than, be more potent than, be longer acting than, produce fewer side effects (including a lower incidence of proarrhythmias such as *torsades de pointes*) than, be more easily absorbed than, or that they may have other useful pharmacological properties over, compounds known in the prior art.

## Biological Tests

### Test A

#### Primary Electrophysiological Effects In Anaesthetised Guinea Pigs

15 Guinea pigs weighing between 660 and 1100 g were used. The animals were housed for at least one week before the experiment and had free access to food and tap water during that period.

Anaesthesia was induced by an intraperitoneal injection of pentobarbital (40 to 50 mg/kg) and catheters were introduced into one carotid artery (for blood pressure recording and blood sampling) and into one jugular vein (for drug infusions). Needle electrodes were placed on the limbs for recording of ECGs (lead II). A thermistor was placed in the rectum and the animal was placed on a heating pad, set to a rectal temperature of between 37.5 and 38.5°C.

25

A tracheotomy was performed and the animal was artificially ventilated with room air by use of a small animal ventilator, set to keep blood gases within

the normal range for the species. In order to reduce autonomic influences both vagi were cut in the neck, and 0.5 mg/kg of propranolol was given intravenously, 15 minutes before the start of the experiment.

- 5 The left ventricular epicardium was exposed by a left-sided thoracotomy, and a custom-designed suction electrode for recording of the monophasic action potential (MAP) was applied to the left ventricular free wall. The electrode was kept in position as long as an acceptable signal could be recorded, otherwise it was moved to a new position. A bipolar electrode  
10 for pacing was clipped to the left atrium. Pacing (2 ms duration, twice the diastolic threshold) was performed with a custom-made constant current stimulator. The heart was paced at a frequency just above the normal sinus rate during 1 minute every fifth minute throughout the study.
- 15 The blood pressure, the MAP signal and the lead II ECG were recorded on a Mingograph ink-jet recorder (Siemens-Elema, Sweden). All signals were collected (sampling frequency 1000 Hz) on a PC during the last 10 seconds of each pacing sequence and the last 10 seconds of the following minute of sinus rhythm. The signals were processed using a custom-made program  
20 developed for acquisition and analysis of physiological signals measured in experimental animals (see Axenborg and Hirsch, Comput. Methods Programs Biomed. 41, 55 (1993)).

- The test procedure consisted of taking two basal control recordings, 5  
25 minutes apart, during both pacing and sinus rhythm. After the second control recording, the first dose of the test substance was infused in a volume of 0.2 mL into the jugular vein catheter for 30 seconds. Three minutes later, pacing was started and a new recording was made. Five minutes after the previous dose, the next dose of test substance was

administered. Six to ten consecutive doses were given during each experiment.

### Data analysis

5

Of the numerous variables measured in this analysis, three were selected as the most important for comparison and selection of active compounds. The three variables selected were the MAP duration at 75 percent repolarization during pacing, the atrio-ventricular (AV) conduction time (defined as the interval between the atrial pace pulse and the start of the ventricular MAP) during pacing, and the heart rate (defined as the RR interval during sinus rhythm). Systolic and diastolic blood pressure were measured in order to judge the haemodynamic status of the anaesthetised animal. Further, the ECG was checked for arrhythmias and/or morphological changes.

15

The mean of the two control recordings was set to zero and the effects recorded after consecutive doses of test substance were expressed as percentage changes from this value. By plotting these percentage values against the cumulative dose administered before each recording, it was possible to construct dose-response curves. In this way, each experiment generated three dose-response curves, one for MAP duration, one for AV-conduction time and one for the sinus frequency (RR interval). A mean curve of all experiments performed with a test substance was calculated, and potency values were derived from the mean curve. All dose-response curves in these experiments were constructed by linear connection of the data points obtained. The cumulative dose prolonging the MAP duration by 10% from the baseline was used as an index to assess the class III electrophysiological potency of the agent under investigation ( $D_{10}$ ).

### Metabolic Stability of Test Compounds

5 An *in vitro* screen was set up to determine the metabolic stability of the compounds of the invention.

The hepatic S-9 fraction from dog, man, rabbit and rat with NADPH as co-factor was used. The assay conditions were as follows: S-9 (3 mg/mL), NADPH (0.83 mM), Tris-HCl buffer (50 mM) at pH 7.4 and 10  $\mu$ M of test  
10 compound.

The reaction was started by addition of test compound and terminated after 0, 1, 5, 15 and 30 minutes by raising the pH in the sample to above 10 (NaOH; 1 mM). After solvent extraction, the concentration of test  
15 compound was measured against an internal standard by LC (fluorescence/UV detection).

The percentage of test compound remaining after 30 minutes (and thus  $t_{1/2}$ ) were calculated and used as a measure for metabolic stability.

The invention is illustrated by way of the following examples.

### Example 35

10 7-[2-(2-[4,5-Bis(4-cyanophenyl)-1H-pyrazol-1-yl]acetyl)amino)ethyl]-N-ethyl-3,7-diazabicyclo[3.3.1]nonane-3-carboxamide

#### (a) 4-[(E)-1-(4-Cyanobenzoyl)-2-(dimethylamino)ethenyl]benzonitrile

*N,N*-Dimethylformamide dimethylacetal (135.2 g, 0.29 mol) was added dropwise, under an inert atmosphere, to a heated (60°C) solution of  
15 4-[2-(4-cyanophenyl)acetyl]benzonitrile (60.2 g, 0.24 mol, Ashley *et al.*, *J. Chem. Soc.* (1942) **103**, 110) in 1,2-dimethoxyethane. The resulting mixture was then filtered and concentrated *in vacuo* to give a residue that was crystallised from MeOH. This gave 27.9 g (38%) of the sub-title  
20 compound.

#### (b) Ethyl 2-[4,5-bis(4-cyanophenyl)-1H-pyrazol-1-yl]acetate

A solution of 4-[(E)-1-(4-cyanobenzoyl)-2-(dimethylamino)ethenyl]-benzonitrile (6.2 g, 20 mmol from step (a) above) in aqueous ethanol (100  
25 mL of 99%) was treated with ethyl 2-hydrazinoacetate hydrochloride (3.5 g, 22.6 mmol). The mixture was stirred at rt overnight before being concentrated *in vacuo*. The resulting residue was diluted with water, which aqueous mixture was extracted with DCM. The organic layer was then separated, dried and concentrated *in vacuo* to give a residue which

was recrystallised from diethyl ether to yield 1.7 g (23.5%) of the sub-title compound.

(c) 2-[4,5-Bis(4-cyanophenyl)-1*H*-pyrazol-1-yl]-*N*-(2-hydroxyethyl)-acetamide

5 A mixture of ethyl 2-[4,5-bis(4-cyanophenyl)-1*H*-pyrazol-1-yl]acetate (3.9 g, 10.9 mmol, from step (b) above), 2-amino-1-ethanol (1.3 g, 21.8 mmol) and triethylamine (0.8 g, 76 mmol) was stirred at 100°C overnight. Water and DCM were added, the product crystallised and was  
10 isolated by filtration to yield 3.53 g of sub-title compound:

(d) 2-[4,5-Bis(4-cyanophenyl)-1*H*-pyrazol-1-yl]-*N*-(2-bromoethyl)-acetamide

15 A mixture of 2-[4,5-bis(4-cyanophenyl)-1*H*-pyrazol-1-yl]-*N*-(2-hydroxyethyl)acetamide (0.7 g, 1.88 mmol, from step (c) above), *N*-bromo-succinimide (0.75 g, 5.64 mmol) and triphenylphosphine (2.22 g, 8.4 mmol) in DCM (100 mL) was stirred under reflux for 3 h. The reaction mixture was allowed to cool before being washed with water. The organic layer was separated, dried and concentrated *in vacuo* to give a  
20 residue that was purified by flash chromatography, eluting with diethyl ether:methanol (95:5), to yield 0.7 g sub-title compound contaminated with triphenylphosphine oxide. This product was used directly in the next step without any further purification.

25 (e) 7-[2-({2-[4,5-Bis(4-cyanophenyl)-1*H*-pyrazol-1-yl]acetyl}amino)ethyl]-*N*-ethyl-3,7-diazabicyclo[3.3.1]nonane-3-carboxamide

A mixture of 2-[4,5-bis(4-cyanophenyl)-1*H*-pyrazol-1-yl]-*N*-(2-bromoethyl)acetamide (0.7 g, 1.6 mmol, from step (d) above), *N*-ethyl-3,7-diazabicyclo[3.3.1]nonane-3-carboxamide (0.32 g, 1.6 mmol, see

Example 6(b) above) and  $K_2CO_3$  (0.55 g, 4 mmol) in acetonitrile (15 mL) was stirred under reflux overnight. Extraction with diethyl ether and water gave an organic layer that was separated, dried and concentrated *in vacuo*. The resulting residue was purified by chromatography on silica gel, eluting with diethyl ether : MeOH (95:5), to yield 0.27 g of the title compound.

# INTERNATIONAL SEARCH REPORT

International application No.  
**PCT/SE00/01254**

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: **24**  
because they relate to subject matter not required to be searched by this Authority, namely:  
**See PCT Rule 39.1.(iv) : Methods for treatment of the human or animal body by surgery or therapy, as well as diagnostic methods.**
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a):

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.
